Coherent states on some new fuzzy spheres

Gaetano Fiore, Francesco Pisacane Università degli Studi di Napoli "Federico II" & INFN - Sezione di Napoli

Final QSPACE Workshop IV, Bratislava

13 February 2019

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Introduction

We have recently [Ref. below] introduced

- a fully O(2)-covariant fuzzy circle $\{S^1_{\Lambda}\}_{\Lambda \in \mathbb{N}}$,
- a fully O(3)-covariant fuzzy 2-sphere $\{S^2_{\Lambda}\}_{\Lambda \in \mathbb{N}}$.

We resp. start from a quantum particle in \mathbb{R}^2 , \mathbb{R}^3 u a confining potential V(r) with a very sharp minimum on the sphere of radius r = 1 and impose a suitable energy cutoff; cutoff and sharpness V''(1) =: 4k of the potential well parametrized by (and diverge with) Λ .

 1^{st} motivation: alg. rel. covariant also under $x_i \mapsto -x_i$ (\neq Madore).

Here I wish to report on some further investigations about the geometry of these S^d_{Λ} : Coherent States (CS);

Spectrum of the space coordinate operators x_i .

G.Fiore, F. Pisacane, J. Geom. Phys. **132** (2018), 423-451, G.Fiore, F.Pisacane, PoS(CORFU2017)184

O(2)-equivariant fuzzy circle - The essentials We previously constructed the O(2)-equivariant fuzzy circle $\{\mathcal{A}_{\Lambda,2}\}_{\Lambda\in\mathbb{N}}$, it is a sequence of unitary irreducible representations $(\pi_{\Lambda,2}, \mathcal{H}_{\Lambda,2})$ of Uso(3) and every $\mathcal{A}_{\Lambda,2}$ acts on the corresponding Hilbert space

 $\mathcal{H}_{\Lambda,2} := span \{ \psi_m | m \in \mathbb{Z}, -\Lambda \leq m \leq \Lambda \}.$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

O(2)-equivariant fuzzy circle - The essentials We previously constructed the O(2)-equivariant fuzzy circle $\{\mathcal{A}_{\Lambda,2}\}_{\Lambda\in\mathbb{N}}$, it is a sequence of unitary irreducible representations $(\pi_{\Lambda,2}, \mathcal{H}_{\Lambda,2})$ of Uso(3) and every $\mathcal{A}_{\Lambda,2}$ acts on the corresponding Hilbert space

 $\mathcal{H}_{\Lambda,2} := span \{ \psi_m | m \in \mathbb{Z}, -\Lambda \leq m \leq \Lambda \}.$

The noncommutative coordinates $x_+ := \frac{x_1 + ix_2}{\sqrt{2}}$ and $x_- := \frac{x_1 - ix_2}{\sqrt{2}}$ generate the *-algebra $\mathcal{A}_{\Lambda,2}$ and their actions read

$$\begin{aligned} x_{+}\psi_{m} &= \begin{cases} \frac{b_{m+1}}{\sqrt{2}}\psi_{m+1} & \text{if } -\Lambda \leq m \leq \Lambda - 1\\ 0 & \text{otherwise,} \end{cases} \\ x_{-}\psi_{m} &= \begin{cases} \frac{b_{m}}{\sqrt{2}}\psi_{m-1} & \text{if } 1-\Lambda \leq m \leq \Lambda\\ 0 & \text{otherwise,} \end{cases} \end{aligned}$$
where $b_{m} := \sqrt{1 + \frac{m(m-1)}{k}}.$

The O(2)-invariant $\mathbf{x}^2 := x_+x_- + x_-x_+ = (x_1)^2 + (x_2)^2$ plays the role of the square distance from the origin.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The O(2)-invariant $\mathbf{x}^2 := x_+x_- + x_-x_+ = (x_1)^2 + (x_2)^2$ plays the role of the square distance from the origin. L, x_+, x_-, \mathbf{x}^2 fulfill the O(2)-covariant relations

$$[L, x_{\pm}] = \pm x_{\pm}, \quad x_{\pm}^{\dagger} = x_{-}, \quad (L)^{\dagger} = L,$$
 (1)

$$[x_+, x_-] = -\frac{L}{k} + \left[1 + \frac{\Lambda(\Lambda+1)}{k}\right] \frac{\widetilde{P}_{\Lambda} - \widetilde{P}_{-\Lambda}}{2}., \qquad (2)$$

$$\mathbf{x}^{2} = 1 + \frac{L^{2}}{k} - \left[1 + \frac{\Lambda(\Lambda + 1)}{k}\right] \frac{\widetilde{P}_{\Lambda} + \widetilde{P}_{-\Lambda}}{2}, \qquad (3)$$

$$\prod_{m=-\Lambda}^{\Lambda} (L - mI) = 0, \quad (x_{\pm})^{2\Lambda + 1} = 0.$$

Here \widetilde{P}_m is the projection over the 1-dim subspace spanned by ψ_m , and k is a sufficiently large function of Λ , for example $k = k (\Lambda) = \Lambda^2 (\Lambda + 1)^2$.

O(3)-equivariant fuzzy sphere - The essentials We previously built a O(3)-equivariant fuzzy sphere, formed by a sequence $\{\mathcal{A}_{\Lambda,3}\}_{\Lambda\in\mathbb{N}}$ of unitary irreducible representations $(\pi_{\Lambda,3}, \mathcal{H}_{\Lambda,3})$ of Uso(4) and the corresponding representation spaces were denoted by

 $\mathcal{H}_{\Lambda,3} := span\left\{\psi_l^m | l \in \mathbb{N}_0, m \in \mathbb{Z}, l \leq \Lambda, |m| \leq l\right\}, \quad \text{where} \quad \Lambda \in \mathbb{N}.$

O(3)-equivariant fuzzy sphere - The essentials We previously built a O(3)-equivariant fuzzy sphere, formed by a sequence $\{\mathcal{A}_{\Lambda,3}\}_{\Lambda\in\mathbb{N}}$ of unitary irreducible representations $(\pi_{\Lambda,3}, \mathcal{H}_{\Lambda,3})$ of Uso(4) and the corresponding representation spaces were denoted by

 $\mathcal{H}_{\Lambda,3} := span \left\{ \psi_l^m | l \in \mathbb{N}_0, m \in \mathbb{Z}, l \leq \Lambda, |m| \leq l \right\}, \quad \text{where} \quad \Lambda \in \mathbb{N}.$

The angular momentum operators $\{L_a\}$ and the coordinate operators $\{x_a\}$ (here a = 0, +, -) are obtained from the corresponding ones $\{L_i\}_{i=1}^3$ and $\{x_i\}_{i=1}^3$ as follows:

$$L_{\pm} := \frac{L_1 \pm iL_2}{\sqrt{2}}, \qquad L_0 := L_3, \qquad x_{\pm} := \frac{x_1 \pm ix_2}{\sqrt{2}}, \qquad x_0 := x_3.$$

O(3)-equivariant fuzzy sphere - The essentials We previously built a O(3)-equivariant fuzzy sphere, formed by a sequence $\{\mathcal{A}_{\Lambda,3}\}_{\Lambda\in\mathbb{N}}$ of unitary irreducible representations $(\pi_{\Lambda,3}, \mathcal{H}_{\Lambda,3})$ of Uso(4) and the corresponding representation spaces were denoted by

 $\mathcal{H}_{\Lambda,3} := span \left\{ \psi_l^m | l \in \mathbb{N}_0, m \in \mathbb{Z}, l \leq \Lambda, |m| \leq l \right\}, \quad \text{where} \quad \Lambda \in \mathbb{N}.$

The angular momentum operators $\{L_a\}$ and the coordinate operators $\{x_a\}$ (here a = 0, +, -) are obtained from the corresponding ones $\{L_i\}_{i=1}^3$ and $\{x_i\}_{i=1}^3$ as follows:

$$L_{\pm} := \frac{L_1 \pm iL_2}{\sqrt{2}}, \qquad L_0 := L_3, \qquad x_{\pm} := \frac{x_1 \pm ix_2}{\sqrt{2}}, \qquad x_0 := x_3.$$

Furthermore, their action is

$$L_{0}\psi_{l}^{m} = m\psi_{l}^{m}, \quad L_{\pm}\psi_{l}^{m} = \frac{\sqrt{(l \mp m)(l \pm m + 1)}}{\sqrt{2}}\psi_{l}^{m\pm 1}, \quad (5)$$

$$x_{a}\psi_{l}^{m} = \begin{cases} c_{l}A_{l}^{a,m}\psi_{l-1}^{m+a} + c_{l+1}B_{l}^{a,m}\psi_{l+1}^{m+a} & \text{if } l < \Lambda, \\ c_{\Lambda}A_{\Lambda}^{a,m}\psi_{\Lambda-1}^{m+a} & \text{if } l = \Lambda, \\ 0 & \text{otherwise,} \end{cases}$$
(6)

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = のへで

$$x_{a}\psi_{l}^{m} = \begin{cases} c_{l}A_{l}^{a,m}\psi_{l-1}^{m+a} + c_{l+1}B_{l}^{a,m}\psi_{l+1}^{m+a} & \text{if } l < \Lambda, \\ c_{\Lambda}A_{\Lambda}^{a,m}\psi_{\Lambda-1}^{m+a} & \text{if } l = \Lambda, \\ 0 & \text{otherwise,} \end{cases}$$
(6)

where
$$A_{l}^{a,m} = B_{l-1}^{-a,m-a}$$
 and
 $A_{l}^{0,m} = \sqrt{\frac{(l+m)(l-m)}{(2l+1)(2l-1)}}, A_{l}^{\pm,m} = \frac{\pm 1}{\sqrt{2}} \sqrt{\frac{(l\mp m)(l\mp m-1)}{(2l-1)(2l+1)}},$ (7)
 $c_{l} := \sqrt{1 + \frac{l^{2}}{k}}, \quad 1 \le l \le \Lambda, \quad c_{0} = c_{\Lambda+1} = 0,$ (8)
with $k = k (\Lambda) = \Lambda^{2} (\Lambda + 1)^{2}$

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = のへで

Moreover, we introduced the operator $\mathbf{x}^2 := x_i x_i = x_a x_{-a}$, which represents the square distance from the origin, and we showed that

$$\mathbf{x}^{2} = 1 + \frac{L^{2} + 1}{k} - \left[1 + \frac{(\Lambda + 1)^{2}}{k}\right] \frac{\Lambda + 1}{2\Lambda + 1} \widetilde{P}_{\Lambda}$$
(9)

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

[here \widetilde{P}_l is the projection on the eigenspace of L^2 linked to the eigenvalue l(l+1)].

Moreover, we introduced the operator $\mathbf{x}^2 := x_i x_i = x_a x_{-a}$, which represents the square distance from the origin, and we showed that

$$\mathbf{x}^{2} = 1 + \frac{L^{2} + 1}{k} - \left[1 + \frac{(\Lambda + 1)^{2}}{k}\right] \frac{\Lambda + 1}{2\Lambda + 1} \widetilde{P}_{\Lambda}$$
(9)

[here \widetilde{P}_l is the projection on the eigenspace of L^2 linked to the eigenvalue l(l+1)]. In conclusion, we proved that

$$\begin{aligned} x_i^{\dagger} &= x_i, \quad L_i^{\dagger} = L_i, \quad [L_i, x_j] = i\varepsilon^{ijh}x_h, \quad [L_i, L_j] = i\varepsilon^{ijh}L_h, \quad x_iL_i = 0\\ [x_i, x_j] &= i\varepsilon^{ijh}\left(-\frac{l}{k} + K\widetilde{P}_{\Lambda}\right)L_h \quad i, j, h \in \{1, 2, 3\},\\ \prod_{l=0}^{\Lambda} \left[L^2 - l(l+1)I\right] = 0, \quad \prod_{m=-l}^{l} (L_3 - mI)\widetilde{P}_l = 0, (x_{\pm})^{2\Lambda + 1} = 0. \end{aligned}$$

The notion of coherent states (CS) has arisen with the problem of saturating the quantum uncertainty relation (UR) on \mathbb{R}^D ; on other manifolds M nontrivial problem! On $M = \mathbb{R}^D$ CS make up an overcomplete set in $\mathcal{H} := \mathcal{L}^2(\mathbb{R}^D)$ yielding a nice resolution of the identity. These properties are usually taken as minimal requirements for defining CS on other M. A set of coherent states $\{\phi_l\}$ is a particular set of vectors of a Hilbert space \mathcal{H} , l is an element of an appropriate label (and topological) space Ω s.t.:

- **CONTINUITY**: the vector ϕ_l is a strongly continuous function of the label *l*.
- **COMPLETENESS** (RESOLUTION ON UNITY): ∃*dl* s.t.

$$I = \int_{\Omega} \phi_I \langle \phi_I, \cdot \rangle dI = \int_{\Omega} |\phi_I\rangle \langle \phi_I| dI.$$

• (WEAKER) COMPLETENESS (TOTAL SET OF VECTORS): $\overline{span \{\phi_l : l \in \Omega\}} = \mathcal{H}_{\mathbb{P}} \times \mathbb{P} \times \mathbb{P}$

Coherent states - Perelomov

In particular A. Perelomov (cf. his book) chooses $\Omega = G$: the system of CS $\{T, \phi_0\}$ is the set $\{\phi_g = T(g)\phi_0\}_{g\in \frac{G}{H}}$, where G is an arbitrary Lie group, H the isotropy subgroup of $\phi_0, T(g)$ is an unitary irreducible representation acting on a Hilbert space \mathcal{H} and $\phi_0 \in \mathcal{H}$.

Coherent states - Perelomov

In particular A. Perelomov (cf. his book) chooses $\Omega = G$: the system of CS $\{T, \phi_0\}$ is the set $\{\phi_g = T(g)\phi_0\}_{g\in \frac{G}{H}}$, where G is an arbitrary Lie group, H the isotropy subgroup of $\phi_0, T(g)$ is an unitary irreducible representation acting on a Hilbert space \mathcal{H} and $\phi_0 \in \mathcal{H}$.

If there exists a left- and right-invariant measure $d\mu(g)$ on it, then every system of coherent states $\{T, \phi_0\}$ fulfills the **CONTINUITY** and **COMPLETENESS** properties.

Coherent states - Perelomov

In particular A. Perelomov (cf. his book) chooses $\Omega = G$: the system of CS $\{T, \phi_0\}$ is the set $\{\phi_g = T(g)\phi_0\}_{g \in \frac{G}{H}}$, where G is an arbitrary Lie group, H the isotropy subgroup of $\phi_0, T(g)$ is an unitary irreducible representation acting on a Hilbert space \mathcal{H} and $\phi_0 \in \mathcal{H}$.

If there exists a left- and right-invariant measure $d\mu(g)$ on it, then every system of coherent states $\{T, \phi_0\}$ fulfills the **CONTINUITY** and **COMPLETENESS** properties.

The system of states which is as close as possible to the classical states is obtained, according to Perelomov, once one chooses ϕ_0 as the state for which the isotropy subalgebra is maximal; in the cases of our interest those states correspond to the ones which minimize the dispersion of the quadratic Casimir C_2 .

$$\Delta L^2(\Delta x_1)^2 \geq rac{1}{4} \langle x_2

 $\Delta L_1 \Delta L_2 \geq \frac{1}{2} |\langle L_3 \rangle|, \quad \Delta L_1 \Delta x^2 \geq \frac{1}{2} |\langle x^3 \rangle|, \quad \Delta L_3 \Delta x^1 \geq \frac{1}{2} |\langle x^2 \rangle|, \cdots$

which are the analogs of the Heisenberg UR. Coming back to Perelomov CS, if we take the irrep $(\pi_{\Lambda}, V_{\Lambda})$ of Uso(3), characterized by

$$\mathbf{L}^{2} = L_{1}^{2} + L_{2}^{2} + L_{3}^{2} = \Lambda(\Lambda + 1),$$

it's easy to see that the dispersion $(\Delta \mathbf{L})^2 := \sum_i \Delta L_i^2$ of \mathbf{L} is minimal for vectors $Y_{\Lambda}^{\pm \Lambda}$ and its explicit value is $(\Delta \mathbf{L})_{min}^2 = \Lambda$.

$UR on S^2$

 $[L_i, L_j] = i\varepsilon^{ijk}L_k$, $[L_i, x^j] = i\varepsilon^{ijk}x^k$ valid on $\mathcal{L}^2(\mathbb{R}^3)$, and $\mathcal{L}^2(S^2)$ implies the UR

 $\Delta L_1 \Delta L_2 \geq \frac{1}{2} |\langle L_3 \rangle|, \quad \Delta L_1 \Delta x^2 \geq \frac{1}{2} |\langle x^3 \rangle|, \quad \Delta L_3 \Delta x^1 \geq \frac{1}{2} |\langle x^2 \rangle|, \cdots$

which are the analogs of the Heisenberg UR. Coming back to Perelomov CS, if we take the irrep $(\pi_{\Lambda}, V_{\Lambda})$ of Uso(3), characterized by

$$\mathbf{L}^{2} = L_{1}^{2} + L_{2}^{2} + L_{3}^{2} = \Lambda(\Lambda + 1),$$

it's easy to see that the dispersion $(\Delta \mathbf{L})^2 := \sum_i \Delta L_i^2$ of \mathbf{L} is minimal for vectors $Y_{\Delta}^{\pm \Lambda}$ and its explicit value is $(\Delta \mathbf{L})_{min}^2 = \Lambda$.

Proposition

The following UR holds on $\mathcal{L}^2(S^2)$, and is saturated by the spin (and Perelomov) CS belonging to each V_{Λ} , $\Lambda \in \mathbb{N}_0$.

$$\Delta \boldsymbol{L}^2 \geq |\langle \boldsymbol{L} \rangle| \qquad \Leftrightarrow \qquad \boldsymbol{L}^2 \geq |\langle \boldsymbol{L} \rangle| \left(|\langle \boldsymbol{L} \rangle| + 1 \right).$$

Applying Perelomov construction one finds the resolution of the identity

$$I = c \sum_{l=0}^{\infty} \int_{SO(3)} d\mu(g) P_{l,g}, \quad P_{l,g} = \phi_{l,g} \langle \phi_{l,g}, \cdot \rangle, \quad \phi_{l,g} := T(g) Y_l^l.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Integration over SO(3) instead of S^2 results only in a change of the normalization constant by 2π . Probably also the sum can be incorporated in the integral over a larger group.

Applying Perelomov construction one finds the resolution of the identity

$$I = c \sum_{l=0}^{\infty} \int_{SO(3)} d\mu(g) P_{l,g}, \quad P_{l,g} = \phi_{l,g} \langle \phi_{l,g}, \cdot \rangle, \quad \phi_{l,g} := T(g) Y_l^l.$$

Integration over SO(3) instead of S^2 results only in a change of the normalization constant by 2π . Probably also the sum can be incorporated in the integral over a larger group.

We can use these arguments for the Madore fuzzy sphere, because of the isomorphism

$$x_i = \frac{2L_i}{\sqrt{n^2 - 1}}, \quad i = 1, 2, 3$$

between the algebra of observables M_n and a suitable irreducible representation $(\pi_{\Lambda}, V_{\Lambda})$ of Uso(3), having dimension $n = 2\Lambda + 1$.

Applying Perelomov construction one finds the resolution of the identity

$$I = c \sum_{l=0}^{\infty} \int_{SO(3)} d\mu(g) P_{l,g}, \quad P_{l,g} = \phi_{l,g} \langle \phi_{l,g}, \cdot \rangle, \quad \phi_{l,g} := T(g) Y_l^l.$$

Integration over SO(3) instead of S^2 results only in a change of the normalization constant by 2π . Probably also the sum can be incorporated in the integral over a larger group.

We can use these arguments for the Madore fuzzy sphere, because of the isomorphism

$$x_i = \frac{2L_i}{\sqrt{n^2 - 1}}, \quad i = 1, 2, 3$$

between the algebra of observables M_n and a suitable irreducible representation $(\pi_{\Lambda}, V_{\Lambda})$ of Uso(3), having dimension $n = 2\Lambda + 1$. Also in this case the dispersion of $\mathbf{x}^2 := x_i x_i \equiv 1$ is minimal on the states $Y_{\Lambda}^{\pm \Lambda}$ and it is

$$(\Delta \mathbf{x})_{\min}^2 = \frac{2(n-1)}{n^2 - 1} = \frac{1}{\Lambda + 1}.$$
 (10)

Coherent states - Our targets

Our first target is give a meaningful definition of spatial dispersion $(\Delta x)^2$ on our fuzzy spaces, which will be a good measure of the localization of a state in configuration space \mathbb{R}^D ; so we adopt the expectation value (variance)

$$(\Delta \boldsymbol{x})^{2} := \left\langle (\boldsymbol{x} - \langle \boldsymbol{x} \rangle)^{2} \right\rangle = \left\langle \boldsymbol{x}^{2} \right\rangle - \left\langle \boldsymbol{x} \right\rangle^{2} = \left\langle \boldsymbol{x}^{2} \right\rangle - \sum_{i=1}^{D} \left\langle x_{i} \right\rangle^{2} \quad (11)$$

on the state;

Coherent states - Our targets

Our first target is give a meaningful definition of spatial dispersion $(\Delta x)^2$ on our fuzzy spaces, which will be a good measure of the localization of a state in configuration space \mathbb{R}^D ; so we adopt the expectation value (variance)

$$(\Delta \boldsymbol{x})^{2} := \left\langle (\boldsymbol{x} - \langle \boldsymbol{x} \rangle)^{2} \right\rangle = \left\langle \boldsymbol{x}^{2} \right\rangle - \left\langle \boldsymbol{x} \right\rangle^{2} = \left\langle \boldsymbol{x}^{2} \right\rangle - \sum_{i=1}^{D} \left\langle x_{i} \right\rangle^{2} \quad (11)$$

on the state; to motivate this choice we note that it is manifestly O(D)-invariant and that if the state is localized in a small region $\sigma_{\langle x \rangle} \subset S^d$ around a point $\langle x \rangle \in S^d$ then $(\Delta x)^2$ essentially reduces to the average square displacement in the tangent plane at $\langle x \rangle$, as one wishes.

Furthermore, for a x_i operator of our fuzzy spaces to approximate well the corresponding coordinate of a quantum particle forced to stay on the unit sphere, its spectrum should fulfill some properties.

Furthermore, for a x_i operator of our fuzzy spaces to approximate well the corresponding coordinate of a quantum particle forced to stay on the unit sphere, its spectrum should fulfill some properties.

In particular we expect that

• The maximal and the minimal eigenvalues, in the commutative limit, must converge to 1 and -1, respectively.

• In the commutative limit we get $\Sigma_{x_i}(\Lambda) \rightarrow [-1,1]$.

Furthermore, for a x_i operator of our fuzzy spaces to approximate well the corresponding coordinate of a quantum particle forced to stay on the unit sphere, its spectrum should fulfill some properties.

In particular we expect that

• The maximal and the minimal eigenvalues, in the commutative limit, must converge to 1 and -1, respectively.

• In the commutative limit we get $\Sigma_{x_i}(\Lambda) \rightarrow [-1,1]$.

According to this, an analysis of $\Sigma_{x_i}(\Lambda)$ is our second target.

In particular we expect that

- The maximal and the minimal eigenvalues, in the commutative limit, must converge to 1 and -1, respectively.
- In the commutative limit we get $\Sigma_{x_i}(\Lambda) \rightarrow [-1, 1]$.

According to this, an analysis of $\Sigma_{x_i}(\Lambda)$ is our second target.

The third target is determine the most *localized* states of our fuzzy spaces, i.e. the ones which minimize the spatial dispersion $(\Delta x)^2$, and (as we will see) this target is strictly linked to the previous one.

If $\hat{\chi}$ is a state of our O(2)-equivariant fuzzy circle, then the construction of Perelomov with $G \equiv SO(3)$ (which is a larger group of the algebra automorphisms), $T \equiv \pi_{\Lambda,2}$ and $\mathcal{H} \equiv \mathcal{H}_{\Lambda,2}$ returns us a system of states which fulfills the **CONTINUITY** and **COMPLETENESS** properties;

The analogous situation occurs for our O(3)-equivariant fuzzy sphere.

If $\hat{\chi}$ is a state of our O(2)-equivariant fuzzy circle, then the construction of Perelomov with $G \equiv SO(3)$ (which is a larger group of the algebra automorphisms), $T \equiv \pi_{\Lambda,2}$ and $\mathcal{H} \equiv \mathcal{H}_{\Lambda,2}$ returns us a system of states which fulfills the **CONTINUITY** and **COMPLETENESS** properties; however the spatial dispersion $(\Delta x)^2$ is only O(2)-covariant.

The analogous situation occurs for our O(3)-equivariant fuzzy sphere.

For this reason, we try to apply the construction of Perelomov to $\hat{\chi}$ also with $G \equiv O(2)$ for the circle and O(3) for the sphere. This is our fourth target

Coherent states - The x^{i} eigenvalue-problem

The covariance of the algebra under O(D) transformations $\mathbf{x} \mapsto \mathbf{x}' = R\mathbf{x}$, $\mathbf{L} \mapsto \mathbf{L}' = R\mathbf{L}$ implies that the spectrum $\Sigma_{x_i}(\Lambda)$ of any coordinate operator x_i of our fuzzy spaces is the same, so we can focus our attention on the spectra of x_1 and x_3 when D = 2 and D = 3, respectively.

Coherent states - The x^{i} eigenvalue-problem

The covariance of the algebra under O(D) transformations $\mathbf{x} \mapsto \mathbf{x}' = R\mathbf{x}$, $\mathbf{L} \mapsto \mathbf{L}' = R\mathbf{L}$ implies that the spectrum $\sum_{x_i} (\Lambda)$ of any coordinate operator x_i of our fuzzy spaces is the same, so we can focus our attention on the spectra of x_1 and x_3 when D = 2 and D = 3, respectively.

For convenience, we study the eigenvalue equations

$$x_1\psi=lpha_1\psi$$
 when $D=2$ and $x_3\psi=lpha_2\psi$ when $D=3.$ (12)

We don't need to make two different discussions, one for D = 2and one for D = 3, for this reason now we start analyzing the three-dimensional problem. First of all, we defined $x_0 := x_3$ and $L_0 := L_3$, but it's also true that the problem of maximizing $\langle x_0 \rangle$ is equivalent to the one of finding the maximal eigenvalue of x_0 ; in conclusion, because of $[x_0, L_0] = 0$, we can simoultaneously diagonalize x_0 and L_0 .

First of all, we defined $x_0 := x_3$ and $L_0 := L_3$, but it's also true that the problem of maximizing $\langle x_0 \rangle$ is equivalent to the one of finding the maximal eigenvalue of x_0 ; in conclusion, because of $[x_0, L_0] = 0$, we can simoultaneously diagonalize x_0 and L_0 .

However, we have to impose this system

$$\begin{cases} L_0 \boldsymbol{\chi}_{\alpha}^{\beta} = \beta \boldsymbol{\chi}_{\alpha}^{\beta} \\ x_0 \boldsymbol{\chi}_{\alpha}^{\beta} = \alpha \boldsymbol{\chi}_{\alpha}^{\beta} \end{cases}$$
(13)

First of all, we defined $x_0 := x_3$ and $L_0 := L_3$, but it's also true that the problem of maximizing $\langle x_0 \rangle$ is equivalent to the one of finding the maximal eigenvalue of x_0 ; in conclusion, because of $[x_0, L_0] = 0$, we can simoultaneously diagonalize x_0 and L_0 .

However, we have to impose this system

$$\begin{cases} L_0 \chi_{\alpha}^{\beta} = \beta \chi_{\alpha}^{\beta} \\ \chi_0 \chi_{\alpha}^{\beta} = \alpha \chi_{\alpha}^{\beta} \end{cases}$$
 (13)

then, using (6) we can easily conclude that

$$eta=m\in\{-\Lambda,\cdots,\Lambda\}$$
 and $oldsymbol{\chi}^m_lpha=\sum_{l=|m|}^\Lambda\chi^m_l\psi^m_l.$ (14)

So we've solved the problem of finding all possible values of β in (13), of course we want now to find the values of α .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

So we've solved the problem of finding all possible values of β in (13), of course we want now to find the values of α .

The O(3)-covariance of our model carries with it some properties and symmetries (like parity), for example it's natural to think that if α is the result of a measurement of a coordinate on a sphere, then one expects that also $-\alpha$ can be obtained if one performs another measurement on another state; and in fact the following proposition is a natural consequence of the parity symmetry.

So we've solved the problem of finding all possible values of β in (13), of course we want now to find the values of α .

We proved also that

Theorem

Let α_0 be the maximal eigenvalue of x_0 and χ_0 be the corresponding eigenvector. It is such that

$$L_0 \chi_0 = 0. \tag{15}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

We proved also that

Theorem

Let α_0 be the maximal eigenvalue of x_0 and χ_0 be the corresponding eigenvector. It is such that

$$L_0 \chi_0 = 0. \tag{15}$$

The last theorem allows us to make a connection between our localyzed states and the classical ones because χ_0 describes a particle concentrated in the x_3 -direction and rotating around the x_3 -axis; then, because of the constraint on the sphere, one expects 'classically' that

$$L_3 = (\underline{\boldsymbol{L}})_3 = (\underline{\boldsymbol{r}} \times \underline{\boldsymbol{p}})_3 = 0,$$

as in (15).

We proved also that

Theorem

Let α_0 be the maximal eigenvalue of x_0 and χ_0 be the corresponding eigenvector. It is such that

$$L_0 \chi_0 = 0. \tag{15}$$

The last theorem allows us to make a connection between our localyzed states and the classical ones because χ_0 describes a particle concentrated in the x_3 -direction and rotating around the x_3 -axis; then, because of the constraint on the sphere, one expects 'classically' that

$$L_3 = (\underline{\boldsymbol{L}})_3 = (\underline{\boldsymbol{r}} \times \underline{\boldsymbol{p}})_3 = 0,$$

as in (15). Furthermore, we proved that *Theorem*

The maximal eigenvalue $\alpha_0(\Lambda)$ of x_0 fulfills

 $\lim_{\Lambda \to +\infty} \alpha_0(\Lambda) = 1.$

Theorem $\Sigma_{x_0}(\Lambda)$ and $\Sigma_{x_0}(\Lambda + 1)$ interlace.

On the other hand, in both dimensions $x^2 = 1$ up to $\frac{1}{\Lambda^2}$, so the problem of minimizing (16)₁ is strictly linked to the one of maximizing $\langle x_1 \rangle$ for D = 2, as for (16)₂ and $\langle x_3 \rangle$ for D = 3.

Coherent states - Most localized states

Now we want to solve the problem of getting the most *localized* states of our fuzzy spaces, as seen previously we want to minimize $(\Delta \mathbf{x})^2$; but the O(D)-covariance implies that $(\Delta \mathbf{x})^2_{\psi} = (\Delta R \mathbf{x})^2_{\psi}$ for every state $\psi \in \mathcal{H}_{\Lambda,D}$ and O(D)- transformation R; according to this we can equivalently try to minimize

$$\begin{cases} (\Delta \mathbf{x})^2 = \langle \mathbf{x}^2 \rangle - \langle x_1 \rangle^2 & \text{when } D = 2, \\ (\Delta \mathbf{x})^2 = \langle \mathbf{x}^2 \rangle - \langle x_3 \rangle^2 & \text{when } D = 3. \end{cases}$$
(16)

On the other hand, in both dimensions $\mathbf{x}^2 = 1$ up to $\frac{1}{\Lambda^2}$, so the problem of minimizing $(16)_1$ is strictly linked to the one of maximizing $\langle x_1 \rangle$ for D = 2, as for $(16)_2$ and $\langle x_3 \rangle$ for D = 3. We've just studied these two *linked* problems, and from them we learned that if we calculate (when D = 3) ($\boldsymbol{\chi}, x_0 \boldsymbol{\chi}$) on

$$\boldsymbol{\chi} = \widetilde{\boldsymbol{\chi}} := \sum_{I=0}^{\Lambda} \widetilde{\chi}^{I} \boldsymbol{\psi}_{I}^{0}, \quad \text{with} \quad \widetilde{\chi}^{I} = \frac{\sin\left[\frac{(I+1)\pi}{\Lambda+2}\right]}{\sqrt{\frac{\Lambda+2}{2}}} \quad \text{if } 0 \le I \le \Lambda,$$

 $(\widetilde{\boldsymbol{\chi}}, x_0 \widetilde{\boldsymbol{\chi}}) >$

$$\left(\widetilde{\boldsymbol{\chi}}, x_{0}\widetilde{\boldsymbol{\chi}}\right) > 1 - \frac{\pi^{2} - \frac{8.9105}{4}}{2\left(\Lambda + 2\right)^{2}} + O\left(\frac{1}{\Lambda^{3}}\right).$$
(17)

$$\left(\widetilde{\boldsymbol{\chi}}, x_0 \widetilde{\boldsymbol{\chi}}\right) > 1 - \frac{\pi^2 - \frac{8.9105}{4}}{2\left(\Lambda + 2\right)^2} + O\left(\frac{1}{\Lambda^3}\right).$$
(17)

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

According to the last inequality and (9) we can infer

$$(\Delta \mathbf{x})_{\widetilde{\mathbf{\chi}}}^2 := (\widetilde{\mathbf{\chi}}, \mathbf{x}^2 \widetilde{\mathbf{\chi}}) - (\widetilde{\mathbf{\chi}}, \mathbf{x}^0 \widetilde{\mathbf{\chi}})^2$$

$$\left(\widetilde{\boldsymbol{\chi}}, x_0 \widetilde{\boldsymbol{\chi}}\right) > 1 - \frac{\pi^2 - \frac{8.9105}{4}}{2\left(\Lambda + 2\right)^2} + O\left(\frac{1}{\Lambda^3}\right).$$
(17)

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

According to the last inequality and (9) we can infer

$$egin{aligned} (\Delta oldsymbol{x})^2_{\widetilde{oldsymbol{\chi}}} &:= \left(\widetilde{oldsymbol{\chi}}, oldsymbol{x}^2 \widetilde{oldsymbol{\chi}}
ight) - \left(\widetilde{oldsymbol{\chi}}, oldsymbol{x}^0 \widetilde{oldsymbol{\chi}}
ight)^2 \ &< & rac{\pi^2 - rac{4.9105}{4}}{\left(\Lambda + 2
ight)^2} + O\left(rac{1}{\Lambda^3}
ight). \end{aligned}$$

$$\left(\widetilde{\boldsymbol{\chi}}, x_0 \widetilde{\boldsymbol{\chi}}\right) > 1 - \frac{\pi^2 - \frac{8.9105}{4}}{2\left(\Lambda + 2\right)^2} + O\left(\frac{1}{\Lambda^3}\right).$$

Comparison with Perelomov & Madore

More precisely, we will compare the spatial dispersion $(\Delta x)^2$ of the Madore fuzzy sphere with the our $(\Delta x)^2$ when the representation spaces are

$$V_{\Lambda} := span \left\{ Y_{\Lambda}^{m} : -\Lambda \leq m \leq \Lambda
ight\}$$

and

$$\mathcal{H}_{\Lambda,3} := \textit{span}\,\{\psi_l^m : 0 \le l \le \Lambda; -l \le m \le l\},$$

respectively.

and

$$\mathcal{H}_{\Lambda,3} := \textit{span}\,\{\psi_l^m: 0 \le l \le \Lambda; -l \le m \le l\},$$

respectively.

So, it's obvious that (definitively)

 $(\Delta \mathbf{x})^2_{min} \leq (\Delta \mathbf{x})^2_{\widetilde{\chi}} < (\Delta \mathbf{x})^2_{min}.$

If D = 2 and we adopt $T = \pi_{\Lambda,2}$ and as G not SU(2) but its subgroup G = U(1); hence $\mathcal{H}_{\Lambda,2}$ carries a *reducible* representation of G, and **COMPLETENESS** (RESOLUTION OF UNITY) is not automatic.

$$(\Delta \mathbf{x})^2_{\boldsymbol{\psi}} = \frac{1}{2\Lambda} + O\left(\frac{1}{\Lambda^2}\right),$$

this goes to zero as $\Lambda \to \infty$, but more slowly than the spatial dispersion of $\tilde{\chi}$ and we proved that the same applies for D = 3.

In D = 3 we choose G not SO(4) but its subgroup G = SO(3), and $T = \pi_{\Lambda}$. The $(\mathcal{H}_{\Lambda}, \pi_{\Lambda})$ is a *reducible* representation of G, more precisely the direct sum of the irreducible representations $(V_l, \pi_l), l = 0, ..., \Lambda$, therefore completeness and resolution of unity are not automatic.
In D = 3 we choose G not SO(4) but its subgroup G = SO(3), and $T = \pi_{\Lambda}$. The $(\mathcal{H}_{\Lambda}, \pi_{\Lambda})$ is a *reducible* representation of G, more precisely the direct sum of the irreducible representations $(V_l, \pi_l), l = 0, ..., \Lambda$, therefore completeness and resolution of unity are not automatic. Consider for simplicity a unit vector of the form $\phi = \sum_{l=0}^{\Lambda} \phi_l \psi_l^l$, and for $g \in G$ let

$$\phi_g := \pi_{\Lambda}(g)\phi, \qquad P_g := \phi_g \langle \phi_g, \cdot \rangle$$
 (18)

 $(\phi_I \equiv \phi)$. The system $A := \{\phi_g\}_{g \in G}$ is complete provided $\phi_I \neq 0$ for all *I* (then it is also overcomplete). Defining $B := \int_{SO(3)} d\mu(g) P_g$ one finds that *B* is proportional to the identity only if $|\phi_I|^2$ is independent of *I* and therefore (since $\|\phi\| = 1$) if $|\phi_I|^2 = 1/(\Lambda + 1)$. Setting $\phi_I = e^{i\beta_I}/\sqrt{\Lambda + 1}$ ($\beta_I \in \mathbb{R}$) we find the following resolutions of the identity, parametrized by $\beta \in (\mathbb{R}/2\pi\mathbb{Z})^{\Lambda+1}$:

$$I = \frac{\Lambda + 1}{2\pi^3} \int_{SO(3)} d\mu(g) P_g^{\beta}, P_g^{\beta} := \psi_g^{\beta} \langle \psi_g^{\beta}, \cdot \rangle, \psi_g^{\beta} := \sum_{m = -\Lambda}^{\Lambda} \frac{e^{i\beta_l}}{\sqrt{\Lambda + 1}} \pi_{\Lambda}(g) \psi_l^{l}.$$

Appendix

Another possibility is to minimize the variance of $\pi_{\Lambda,2} [L^2]$, but one can easily show that in this case the "coherent states" (the ones minimizing that variance) are ψ_{Λ} and $\psi_{-\Lambda}$, which are not meaningful in the high energy limit $\Lambda \to +\infty$.

Appendix

Another possibility is to minimize the variance of $\pi_{\Lambda,2} [L^2]$, but one can easily show that in this case the "coherent states" (the ones minimizing that variance) are ψ_{Λ} and $\psi_{-\Lambda}$, which are not meaningful in the high energy limit $\Lambda \to +\infty$.

Incidentally, some authors consider also two definitions of sets of optimally localized states on the spin sphere alternative to the one adopted by Perelomov: the set of "intelligent states", that saturate the uncertainty relation $\Delta L_1 \Delta L_2 \geq |\langle L_3 \rangle|/2$, and the set of "minimum uncertainty states", for which $\Delta L_1 \Delta L_2$ has a local minimum (note that then in general $\Delta L_1 \Delta L_3$, $\Delta L_2 \Delta L_3$ are not minimized). But neither one is invariant under arbitrary rotation, in contrast with the definition of Perelomov and of the present work; one can easily show that these states are "fewer" than the points of S^2 , i.e cannot be put in one-to-one correspondence with the points of S^2 , but just of a finite number of lines on S^2 .
